

Hebgen

Date

Fri, 01/03/2025 - 12:55

Activity

Skiing

I skied above hebgen today, and found some encouraging signs. No collapsing on the way up, but I did get a few small ones on the way out below 7k. A pit on an east facing slope at 8800' had 90 cm of snow, and I got a poorly-defined propagation at ECTP16 in the big, granular facets that make up the base of the snowpack. The newer snow slab was quite cohesive, although there is a thin rain crust that formed yesterday afternoon. The lake is currently a slushy experience.

Region

Lionhead Range

Location (from list)

Hebgen Lake

Observer Name

Sam Reinsel
